

BFL-Mastix waterstops and their guarantees

The BFL Mastix company offers guarantees to concrete constructors, which are based on longterm observations of the watertightness in constructions during more than 20 years.

Repairworks on eminent powerdams or even of a simple manure pit, have fully proved the efficiency of BFL-Mastix waterstops during all their service life since the 1980 years.

Why ?

BFL-Mastix waterstops maintain all their properties, as long as the adjacent concrete exists.

Only when this concrete is demolished, the BFL-Mastix waterstops separate from the concrete.

To assure the watertightness with BFL-Mastix waterstops, the quality of the carrying out job has to be proved, thus obtaining the real longterm watertightness.

This attention is finally possible on every concrete construction job.

All experiences put together, allow to design new construction forms and obtain their required good permanent watertightness.

Never intermingle the watertightness of a concrete with the watertightness of a concrete structure.

The watertightness of a concrete structure depends entirely on the watertightness of the joints.

The alkalinity of the concrete does not lead to any property alteration of the BFL-Mastix waterstops, but contributes to their longterm guarantee.

Chosing BFL-Mastix waterstops influences the practical sense, more than referring to the properties, which are finally based on long-year guarantees.
